Key Concepts and Theoretical Foundations

Linear Independence and Dependence

Understanding whether vectors are linearly independent is crucial for defining bases and dimensions.

Vectors $v_1, v_2, \dots, v_k$ are linearly independent if the only solution to $a_1v_1 + a_2v_2 + \dots + a_kv_k = 0$ is $a_i = 0$ for all i .

Dependent vectors can be expressed as linear combinations of others, simplifying the basis selection process.

Eigenvalues and Eigenvectors

These are critical for understanding matrix transformations and system dynamics.

Eigenvalues are scalars λ such that $Av = \lambda v$ for some non-zero vector v (the eigenvector).

Eigenvalues determine the nature of linear transformations, including stability and oscillations in systems.

Diagonalization

Diagonalization simplifies matrix powers and functions, essential in differential equations and systems theory.

A matrix A is diagonalizable if there exists an invertible matrix P such that $P^{-1}AP = D$, where D is diagonal.

Diagonalization relies on the existence of enough linearly independent eigenvectors.

Inner Products and Orthogonality

These concepts extend the geometric intuition of angles and lengths to abstract vector spaces.

Inner product spaces allow definitions of length (norm) and angles, facilitating the study of orthogonal projections.

Orthonormal bases simplify computations and are fundamental in Fourier analysis, signal processing, and data analysis.

Spectral Theorem

A cornerstone in linear algebra for symmetric matrices, stating that every real symmetric matrix can be orthogonally diagonalized.

Provides a way to decompose matrices into their spectral components.

Enables efficient computation of matrix functions, such as matrix exponentials.
